

A better way to process engineering design changes

Product Overview

The ECx Manager is a web-based, turnkey system designed to tightly connect your engineering design changes to what you are actually building on the shop floor. It allows engineering designers to create and modify ECNs from within their design software of choice, while they are actually making the changes.

Benefits

Easily Manage ECNs

ECx Manager organizes all ECNs into a coherent and visual structure that is easy to manage. This means that both engineers as well as engineering managers can quickly access information relevant to their workflow.

Faster ECN Process

With a clean disposition, the approval process is shortened. Targeted parties get the ECN in the order that the user chooses. This ensures that the wrong user never has to look at someone else's ECN.

Highly Customizable

We can work closely with our clients and developers to customize the already feature-rich ECx Manager to suit their needs. We do this by altering ECx Manager to more closely fit with your company's practices.

Features

Engineering Manager

- Review and approve changes through a highly visual UI
- Track assigned engineering change tasks
- View engineering change metrics
- Flexible approval workflow

Designer

- Create and update ECNs directly from your CAD
- Attach and store any relevant documentation

Manage Users

ECx Manager allows various user types as well as groups to fit the needs of your team. These users and groups are then used during the approval path designation. Once a user or group is defined it can be used for dispositions.

Control the Approval Path

ECx Manager let's you choose who the approval path goes through. This is done by drag-n-dropping users, groups or both into a path tree. Once a path is constructed, it can be saved as a template for future use. This allows the ECN initiator to fully control the ECN cycle.

Easily & Quickly Manage ECNs

The user who is requested to approve an ECN has a highly visual UI that allows everything to be done from ECx Manager. ECx Manager also integrates with Outlook allowing automatically generated notifications. These features ensure the fastest ECN process possible.

Data Stored for Review

ECNs are automatically saved. This allows the user to easily review and track previously made change requests. A user can easily sift through any changes ever made as well as their respective dispositions.

Flexible Solution

Every company has their own needs and methods. We can customize ECx Manager to fit your company-specific needs. We work closely with our customers as well as our developers to develop customizations to fit customer needs. This ensures that ECN integrates seamlessly into your current workflow.
