

ORACLE
NetSuite

Automated, Real time, bi-directional integration between nesting software and NetSuite

Benefits

- Eliminate manual data entry in your nesting software
- Shop floor sees new nesting requirements automatically
- Accurate capture of material usage written back to NetSuite Work Orders
- Automated background process with no day to day human interaction
- Secure integration using NetSuite's API

1. Synchronize nesting software sheet stock library

If your nesting tool has a sheet library, NestLink will keep the sheet library synchronized with NetSuite based on new item receipts from NetSuite. When a new item receipt is created for a sheet in NetSuite, NestLink will automatically create the sheet record in the nesting software.

2. Create nesting software part records

NestLink will create new parts in the nesting software based on the NetSuite Work Order requirements and part information. If part geometry can be found, NestLink will also upload the geometry to the part record.

3. Create new nesting work orders

When a new Work Order is planned and released in NetSuite, NestLink automatically captures relevant Work Order information and creates new records in your nesting software, matching the NetSuite work order requirements.

4. Update NetSuite bill of material

After parts are nested and cut, NestLink automatically updates the NetSuite Work Order with Issue Component and Completion transactions. Quantities, Labor and material consumption are all accurately reported back to the NetSuite Work Order.
